Chapter 1

Introduction

1.1 Purpose

Our team will develop Travlendar+, a calendar-based application that aims to provide a schedule of user appointments, giving a plan to organize his daily life. The main goals the app must fulfill are:

- G1 The system should be able to interact with the user;
- **G2** Allow the user to insert an appointment according to his necessities and his preferences;
- **G3** The system S.P.W. to modify an inserted appointment;
- G4 The system S.P.W. to create a valid schedule of the user appointments when requested fare ref alla def and display the scheduling result;
- **G5** The system should let the user create valid multiple schedules and decide which one is chosen the current day;
- G6 The system should offer the possibility to create a new account;
- G7 The system should be able to handle a login phase;
- **G8** The system S.B.A to book the travel means involved in the current schedule under user approval;

G9 The system S.B.A. to display in real time user position and the directions to be followed in order to arrive to the next appointment on a dinamically updated map;

G10 The system should give to the signed user the possibility to recover their e-mail or password.

1.2 Scope

Here we provide a brief description of the aspects of the reality of interest which the application is going to interact with.

User can receive an appointment on a certain date, time and location (over a region), that can be reached using different available travel means. The appointment can be held either at a specific time or in a time interval and lasts for a certain amount of time. An appointment can be recurrent, in other words, it repeats regularly over time (e.g., lunch, training, etc.). User can travel with someone else and can pick up or leave off these people during the day.

User can have his own travel means and a pass for public transportation. The travel means considered in this scenario can be grouped in three categories: public, shared or private.

- Public travel means: these include trains, buses, underground, taxis, trams. They have to be taken in their designated stops. User must have a valid ticket in order to get on a public travel means (except for taxis, that pick up the user wherever he wants upon a call and do not require any ticket);
- Shared travel means: these include car and bike. They are located in specific places and require a reservation in order to be used by the user;
- Private travel means: vehicles owned by the user. They can be cars, bikes, motorbikes.

Weather conditions can change during the day affecting travel means choice. At the beginning of the day, or on demand, user can request a schedule of his daily appointments, following some criteria evaluated according to their assigned priority and satisfying some constraints imposed by the user. When a new appointment is received, user creates a

new item in the application and saves it in the appointment list. User can request the application to reschedule the appointments because of unexpected changes of his plan (e.g. a cancelled appointment).

1.2.1 World Phenomena

- User receives a new appointment;
- User picks up a person;
- User owns private travel means and/or passes for public transportation;
- User wakes up;
- User pass expires.

1.2.2 Shared Phenomena

- Shared travel mean moves;
- Shared travel mean is not available anymore;
- Wheather condition changes;
- Public travel means reach a stop-place;
- Public travel means are late;
- Public travel means are not available due to a strike day;
- User requests a schedule to the machine;
- User inserts a new appointment into the application;
- User requests to book rides;
- User moves.

1.3 Definitions, Acronyms, Abbreviations

 $sinonimi: \ Appointment/meeting \ Schedule/Scheduler \ System/Application \ preferences/constraint$

def:

preferences: constraints on appointments or schedules

la toglierei questa in quanto abbiamo definito i optimization criteria nella sezione schedule model Opt Criteria: criteria followed by the scheduler in order to optimize

travel option: the combination of travel path and travel means that allow to reach one spot from another.

travel option data: additional information about a travel option:

- Cost;
- Traveling time;
- Carbon emission;
- distance (KM);
- Graphical representation of the path.

Schedule: a set of time-ordered and not overlapping appointments where their starting times are fixed and they're linked to each other by a path covered with a specific transportation mean

Valid Schedule: a Schedule which:

- is optimized according to the criteria chosen by the user;
- ensures that the user will be on time for all his appointments;
- respects the constraints imposed by the user

relative path: portion of a path travelled by the same travel means Scheduling result: the set of:

- Graphical representation of the path that will be travelled by the user
- money spent for each relative path
- total money spent
- Length of the path expressed in KM
- Length of relative path

- Carbon footprint emission
- Estimated travel duration of each relative path
- Total estimated travel time

current appointment: an appointment which has startingTime >= currentTime and data=currentDate, where currentTime and currentDate are the actual time reference of the system;

convenzioni: variables are italic states are bold

abbr: GPS: Global Positioning System GUI: Graphical User Interface ETA: Estimated Time of Arrival S.P.W.: should provide a way S.B.A.: should be able API: Application Programming Interface CRUD: create/read/update/delete URL: Uniform Resource Locator

1.6 Document structure

Chapter 2

Overall Description

2.1 Product Perspective

2.1.1 User Model

A user is represented within the application by his password and his e-mail. Some important informations about him are held by the following parameters:

- travelPass: indicates if the user has a pass for public transportation;
- hasBike: indicates if the user has his own car;
- has Car: indicates if the user has his own bicycle.

2.1.2 Appointment Model

An appointment is represented within the application by a set of parameters:

- duration: the time extension of the appointment
- date: the day in which the appointment is held;
- starting Time or time Interval: the first should be given if the starting hour is well-known (deterministic), otherwise a time interval in which the appointment will be held it's provided.
- location: identifies the coordinates of the place where the appointment will be held;
- recurrent: specifies if the appointment will be repeated over a fixed period of time;

• people Travelling: represents a variation occourring when the user picks up or leaves off someone.

The life cycle of an appointment can be represented by the following statechart:

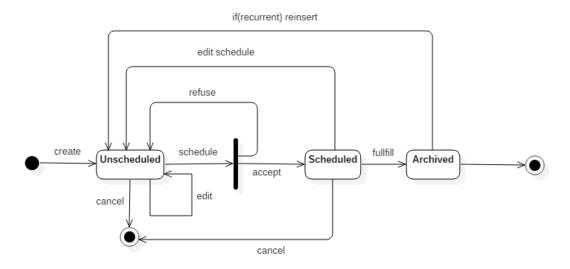

Figure 2.1: Appointment statechart

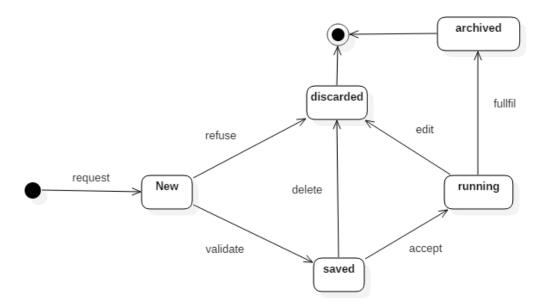

A newly-created appointment is **Unscheduled**. It could remain **Unscheduled** either when edited or there isn't a possible arrangement when a schedule is performed. Otherwise it becomes **Scheduled** if there's a feasible way to arrange it. When a scheduled appointment is edited all the appointments in that schedule return to be **Unscheduled**, because they can possibly cause a different schedule. When a scheduled appointment is fullfilled it becomes **Archived** and stored in the schedule history. If this last one is a recurrent appointment it must be reinserted in the list of unscheduled appointments so it will become **Unscheduled** again. The user can cancel an appointment in every moment.

2.1.3 Schedule Model

A schedule is a subset of Appointments of a given day, ordered by the scheduler following the criteria described below. A schedule is characterized by the following variables:

• date;

- startingPosition: is the starting location of the user (e.g. user's home);
- startingNumberOfPeople: the number of people that must reach the first appointment.
- wake Up Time: it is the starting time from which the schedule should start arranging appointments.

When a schedule is requested by the user it is **New**, this last can be either validated or refused by the scheduler according to the definition of valid schedule **fare riferimento** alla **def**. In the first case the schedule is **saved** in the second one the schedule is **discarded** and a warning to the user is sent. In order to start a schedule the user must accept one of them from the saved ones, after that the schedule is **running**. If the user edits one of the appointments belonging to the running schedule, this one is not more valid and become **discarded** when a schedule is fullfilled by the user this last is **archived** by the system.

The optimization criteria

Prioritizing criteria for the schedule optimization that can be chosen by the user are the following:

• Minimize carbon footprint: the scheduler will try to minimize the amount of kilometers travelled in polluting means;

- *Minimize money spent*: the scheduler will try to avoid expensive means and to exploit the public ones (especially if the user has a pass) or going by bike or on foot;
- Minimize travelling time: the scheduler will compute the quickest possible path reaching all the appointments locations.

2.1.4 Constraints

Constraints are impositions on some parameters managed by the system during the process of scheduling the appointments. We can distinguish between constraints on schedule and contraints on the single appointment. These can be selected by the user when he inserts an appointment or when he requests a schedule, otherwise the constraints are initialized to default values.

Constraints on schedule

- Maximum travelling distance with a specific travel mean: the user can set a maximum amount of km to travel with a specific travel mean;
- Travel means time slots: user can specify a time interval in which a travel mean can be used;
- User can deactivate a particular travel mean;
- User can select which travel mean he uses under certain weather condition.

Constraints on appointment

• User can deactivate a particular travel mean.

2.1.5 Class Diagram

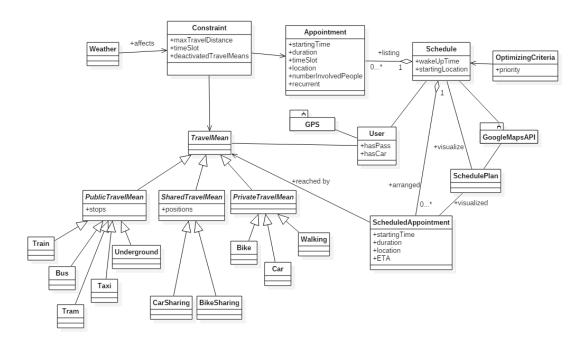

Figure 2.2: System Class Diagram

2.2 Product Functions

The following requirements are derived in order to fullfill the specified goals.

Requirements for **G1**:

- The system should offer a GUI that handles All the interactions with the user.
 Requirements for G2:
- R2 The system S.B.A. to retrieve information from the user about his appointments;
- R3 The system S.B.A to store an appointment in his memory;

 Requirements for G3:
- R4 The system should let the user change the parameters and the constraints of an inserted appointment;

R5 The system S.B.A to rewrite the appointment in his memory with his new parameters;

Requirements for **G4**:

- **R6** Allow the user to set the parameters of the schedule (2.1.3), or to accept the default values;
- **R7** Allow the user to select the optimization criteria (2.1.3) for the schedule;
- R8 The system S.B.A. to gather information from external APIs about:
 - travel options with related travel option data;
 - weather forecast;
 - strike days;
- R9 The system S.B.A. to select the best travel option according to the optimization criteria taking into account:
 - user constraint
 - user parameters (aggiungere riferimento a user model)
 - travel option data
 - weather forecast
 - information about strike day
- R10 The system S.B.A to store valid schedules requested by the user

Requirments for **G5**:

- ${f R11}$ The system should let the user accept a schedule from the saved ones Requirements for ${f G6}$:
- R12 The system S.B.A to handle a registration phase in which the user will provide an e-mail and a password
- R13 The system S.B.A. to verify the e-mail given by the user by sending a confirmation e-mail to his address

Requirements for **G??**:

- R14 The system S.B.A to recognize a registered user given an e-mail and a password
- R15 The system S.B.A. to retrieve information from the user about his registration informations, i.e. his e-mail and password (da verificare se serve o meno);
 Requirements for G8:
- R16 The system should offer to the user a way to link all his travel service accounts into the Travlendar+ account;
- R17 The system S.B.A to book a travel mean through external API offered by third party application in which the user is signed

Requirements for **G??**:

- ${f R18}$ The system S.B.A to retrive the graphical representation of a path from an external API
- R19 The stystem S.B.A to retrive the travel option from an external API (questa che già si è detta ma serve anche per questo goal come facciamo?)
- **R20** The S.B.A to retrieve the length of a path from an external API Requirements for **G??**:
- **R21** The system S.B.A to retrive the position of the user from his GPS
- **R22** The system S.B.A. to retrive from an external API the directions to give to the user for reach the next appointment;

Requirements for **G??**:

- R23 The system should be able to send the password of a user to his e-mail
- R24 The system should be able to display a user e-mail given his password

2.2.1 User characteristics

Users can use our system when they want something that allows them to schedule their meetings according to their necessities and constraints. Necessary conditions for the users in order to use the system are:

• He must have an (specificare meglio in seguito in quale dispositivo occorre farla girare) connected to the internet in which the application runs

This is the only requirement that is needed. Anyway additional characteristics of the user lead to the exploitment of all the system features. In fact some of them are guaranteed only after having submitted some information to the application. In this sense, welcomed user's characteristics are:

- The ownership of some travel means
- The ownership of travel passes
- The registration to sharing services

Beside these, an obvious tacit assumption is that the user has a valid age to move where he wants with autonomy.

2.2.2 Assumptions, dependencies and constraints

- The system should be able to retrieve information about public travel means. In particular:
 - information about delays;
 - information on possible strike days.
- The system should be able to retrieve information about shared means. In particular:
 - position of the available ones;
 - prices per time unit;
- There exist external APIs that allow to:
 - retrieve all travel options and travel option data
 - signed user to book and pay for all travel services
 - retrieve information about weather forecast
 - retrieve a graphical representation of a path
 - retrieve the length of a path

- The device on which the application runs is connected to the internet;
- The user has a GPS active in every moment
- every user has at least one personal e-mail

Chapter 3

Specific requirements

3.1 External Interface Requirements

The application shows its best potential when running in a mobile device, for instance a smartphone or a tablet. This permits to extend the features and the automatic tasks of the application, thanks to the built-in device functionalities. However, a computer client version of the application can be installed, too.

3.1.1 User interfaces

The user can interact with the application through several graphical interfaces:

1. **Registration/login interface**: allows the user to insert credentials in order to registering or logging into the system;

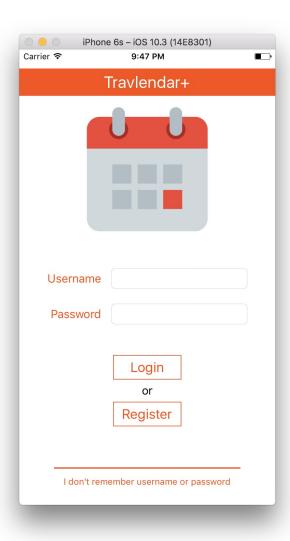

Figure 3.1: Registration/login interface

2. **User account interface**: user can specify his profile characteristics, such as his passes, car and/or bike ownership;

Figure 3.2: User account interface

- 3. **Appointment CRUD interface**: allows creating, showing and editing appointment parameters and related constraints;
- 4. **Non-scheduled appointments interface**: provides a list of all inserted appointments, but not scheduled yet (includes the possibility to delete an item of the list);
- 5. **Schedule interface**: user can set parameters, contraints, optimization criteria and request a schedule creation for a given date;
- 6. Schedules result interface: shows the computation of the requested schedules

for a given date and asks the user to select one, then waits for confirmation for that;

- 7. **Schedule progress interface**: permits to keep track of the completeness percentage, indicating the directions to be followed by the user in a map, in order to arrive to the next appointments;
- 8. **Tickets/rides reservation interface**: allows user to buy tickets for public travel means and/or reserve a ride for the shared travel means;
- 9. Appointments history interface: shows a list of archived appointments;

3.1.2 Hardware interfaces

Hardware interfaces are physical linking across which two or more separate components of a system exchange information. A hardware interface is described by the mechanical and electrical signals at the interface and the protocol for sequencing them. There are no interesting hardware interfaces in our scope.

3.1.3 Software interfaces

Software interfaces are logical linking across which two or more separate applications running on a system exchange information.

• API: information can be exchanged through HTTP request/response;

3.1.4 Communications interfaces

Communication interfaces allows two different architectures of the system to exchange information through communication channel. These non-homogeneous components of the system can communicate thanks to the following software interfaces and protocols:

- Cellular connectivity: mobile devices can connect to the internet thanks to LTE standard;
- GPS: cellular can retrieve his coordinates position through NMEA protocol;
- QRCode: present in most of the shared means, allows to quickly identify the nearby transportation, associating that to an URL;

3.2 Functional requirements

3.2.1 Scenarios

Here are some scenarios that describe the usage of the system.

Scenario 1

Giovanni will start the fourth year of his Master's degree. Surfing the internet, he finds out that his lesson schedule for the first semester it has been published. Giovanni decides to fill in the application with his new appointments related to lessons attendance. In fact he knows where to go, at which time and day and for which amount of time. Since he knows that these events will going to happen for 3 months, he sets them as recurrent.

Scenario 2

da rileggere scritta veloce Giovanni want to start training but he doesn't know what are the best hours in which he can run in accord to his appointments, he know only that he can run between 5 and 7 pm, for 45 minutes. he can insert this last appointment in the application whitout specify the exactly starting hour and the system will give him the best hours in which he can run

Scenario 3

da rileggere scritta veloce Giovanni has scheduled his appointments but at lunch time his son called him because he needed a ride for go back to home. Giovanni decided to help his son and so he brought him home. now the current running schedule is not more valid so he request to the system a reschedule of his appointment according to his position and the hour of day in which he is.

3.2.2 Use cases

User log-in

Name: User log-in

Actors: User

Goals: (Goal del login

Input Condition: The user is registered to the system

Event Flow:

1. The user needs to log-in the application, so he runs it;

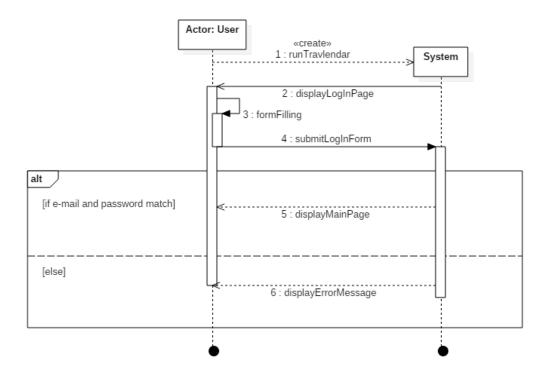

- 2. The system provides to the user a form to fill;
- 3. The user fills up the form with the his e-mail and his password (as said in 2.1.1)
- 4. The user submits the form to the system;
- 5. The system checks the user identity and provides to the user the main application page (reference to the main application page)

Output Condition: The user submits the form after having filled it with a matching e-mail and password.

Exceptions: The user submits the form after having filled it with a wrong email or password.

Mapping on requirements:

- Events from 3 through 5 granted by (requirement che può recuperare informazioni dell'utente riguardo i dati della registrazione);
- Event 6 grandet by (requirement che il sistema può controllare se l'identità di un utente è giusta;

Appointment creation

Name: Appointment creation

Actors: User

Goals: G1

Input Condition:

- The user is registered to the system
- The user is logged in to the systems

Event Flow:

- 1. The user wants to add a new appointment to his schedule;
- 2. The user requests the appointments page
- 3. The system provides the appointments page
- 4. The user requests the creation of a new appointment to the application;
- 5. The system provides to the user a form to fill;
- 6. The user fills up the form with the parameters (specified in 2.1.2) and constraints (specified in 2.1.4 about the new appointment;
- 7. The user submit the form to the system;
- 8. The system allocates the new appointment as Unscheduled (referring to statechart in figure;)
- 9. The system sends a confirmation to the user.

Output Condition: The user submit the form after filling it with all the parameters needed. Constraints fields could also be left blank (they are optional);

Exceptions:

- 1. Some fields of the form referring to parameters are left blank;
- 2. The *location* field doesn't belong to the domain area of the application (riferimento alla domain assumption della regione)

Mapping on Requirements:

- Events 4 through 7 are granted by (requirement che il sistema può recuperare informazioni riguardanti un appointment)
- Event 7 is granted by (requirement che il sistema è in grado di memorizzare un appointment

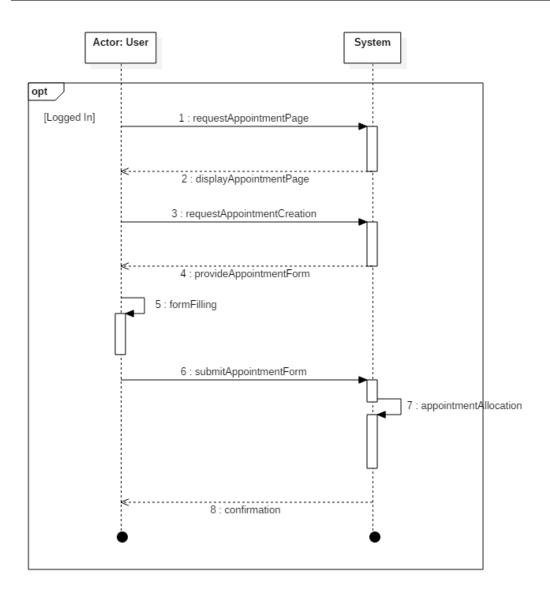

Figure 3.3: Appointment creation sequence diagram

In the sequence diagram there's the assumption that the log-in proceeds successfully. The log-in procedure referenced is the one explained in (use case del log-in.)

ScheduleSelection

Name: Multiple Schedules creation				
Actors: User				
Goals: aggiungere rif al goal				

Input Condition:

- The user is registered to the system
- The user is logged in to the systems

Event Flow:

- 1. The user wants to compare multiple schedules;
- 2. The user requests the schedules page;
- 3. The system provides the schedules page;
- 4. The user selects a schedule to be run;
- 5. The system display the mainpage with the schedule results (fare riferimento alla definizione)

Output Condition: The user selects a schedule to be run

Exceptions:

Mapping on Requirements:

• Events are granted by the requirment R10 (mettere riferimenti)

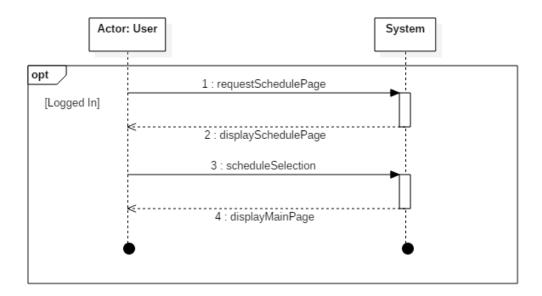

Figure 3.4: Appointment creation sequence diagram

Appointment editing

Name: Appointment editing			
Actors: User			
Goals: (goal che l'utente può modicare un appointment)			
Input Condition: The user is logged-in to the system			

Event Flow:

- 1. The user wants to modify an appointment of his schedule;
- 2. The user selects the appointment to modify;
- 3. The system provides to the user the appointment form with all the parameters and constraints (with reference to and that were specified yet by the user;
- 4. The user edits the fields of the form;
- 5. The user submit the form to the system;
- 6. The system set the appointment as Unscheduled with the new parameters (referring to statechart in figure ..);)
- 7. The system sends a confirmation to the user.

Output Condition: The user submits the form after having filled it with all the parameters he wanted to modidy. The fields about constraints could also be left blank (they are optional)

Exceptions:

- 1. Some fields of the form referring to parameters are left blank;
- 2. The *location* field doesn't belong to the domain area of the application (riferimento alla domain assumption della regione)

Mapping on Requirements:

- Events 3 through 5 are granted by (the requirement that says that the system should let the user change the parameters and the constraints of an inserted appointment)
- Event 6 is granted by (requirement che il sistema è in grado di memorizzare un appointment modificato

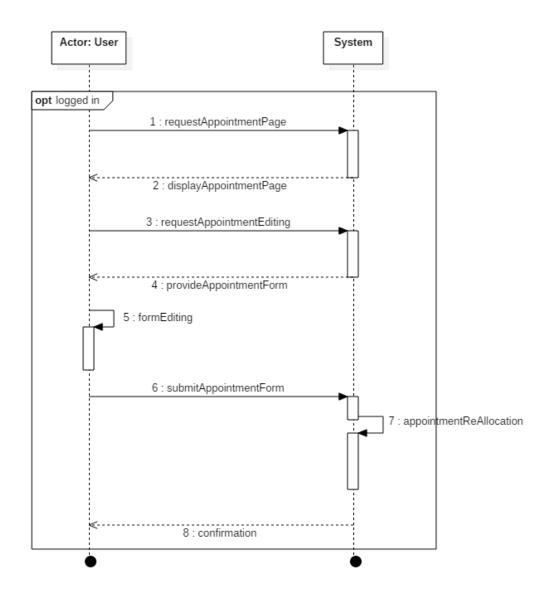

Figure 3.5: Appointment editing sequence diagram

Schedule appointments

Name: Schedule appointments			
Actors: User, External API			
Goals: (goal che permette di fare uno scheduling degli appuntamenti			
dell'utente)			
Input Condition: The user is logged-in to the system (in futuro mettere			
che l'actor è un logged user e togliere questo, se ci piace di più			

Event Flow:

- 1. The user wants to schedule his appointments;
- 2. The user selects the current appointments to schedule of the current day;
- 3. The system provides to the user the schedule form with all the parameters and optimization criteria (with reference to (parametri dello schedule and opt criteria dello schedule that were specified yet by the user;
- 4. The user fills up the fields of the form;
- 5. The user submit the form to the system;
- 6. The user retrieves information from external APIs about travel options and related travel option data, weather forecast and strike days
- 7. The system set the appointment as Unscheduled with the new parameters (referring to statechart in figure ..);)
- 8. The system sends a confirmation to the user.

Output Condition: The user submits the form after having filled it with all the parameters he wanted to modidy. The fields about constraints could also be left blank (they are optional)

Exceptions:

- 1. Some fields of the form referring to parameters are left blank;
- 2. The *location* field doesn't belong to the domain area of the application (riferimento alla domain assumption della regione)

Mapping on Requirements:

- Events 3 through 5 are granted by (the requirement that says that the system should let the user change the parameters and the constraints of an inserted appointment)
- Event 6 is granted by (requirement che il sistema è in grado di memorizzare un appointment modificato

User registration

Name: User registration

Actors: User, external e-mail service

Goals: G5

Input Condition:

Event Flow:

- 1. The user wants to register to the system, so he runs the application;
- 2. The system display the login/registration page
- 3. The user fills the form (the form is present on the first page that the application display after the startup)
- 4. The user submit the filled form to the system
- 5. The system send a confirmation e-mail to the user;
- 6. The system display a message in which the user is informed that he will recieve a confirmation e-mail;
- 7. The user confirm the registration by clicking a link in the received e-mail;
- 8. A confirmation message is sent to the application;
- 9. A registration completed message is sent to the user by the system.

Output Condition: The registration is confirmed to the system;

Exceptions:

- 1. The e-mail given by the user is fake
- 2. The user makes a typo during the insertion of his e-mail

Mapping on Requirements:

- Events 1 through 3 are granted by R12;(AGGIUNGERE I RIFERIMENTI)
- Evens 4 through 6 are granted by R13. (AGGIUNGERE I RIFERIMENTI)

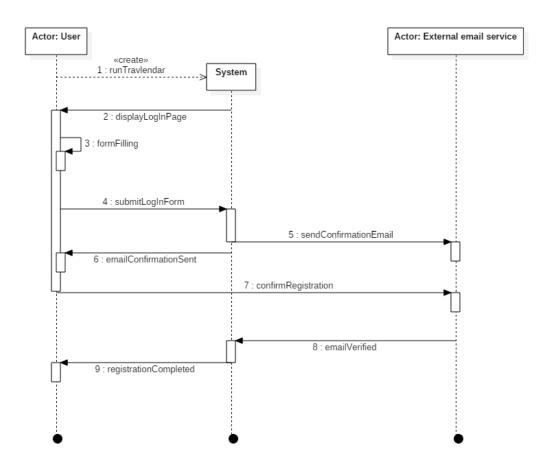

Figure 3.6: Registration sequence diagram

Booking phase

Name: Booking phase

Actors: User, external apis

Goals: FARE RIFERIMENTO AL GOAL CORRETTO

Input Condition:

- The user must be logged in to the system;
- The user must have selected a schedule to be run;
- The user must have linked to the system his external accounts; (FARE RIFER-IMENTO ALLA SEZIONE DOVE SI PARLA DI QUESTA COSA)
- The user would like to buy the tickets for the travel means involved in the running schedule.

Event Flow:

- 1. The System, after the user have selected a schedule, asks to the user if he want to buy the ticket for the running schedule;
- 2. The User confirm to the system his intention;
- 3. The System perform a call to the travel means APIs for buying the ticket;
- 4. The APIs send back a confirmation message of the purchase;
- 5. The system send a confirmation message to the user.

Output Condition: The User recieve the confirmation message;

Exceptions:

- 1. The user doesn't have enough money in his card to complete the transaction;
- 2. there aren't free sits in one of the selected travel means;

Mapping on Requirements:

Events 3 through 5 granted by R17;(AGGIUNGERE I RIFERIMENTI)

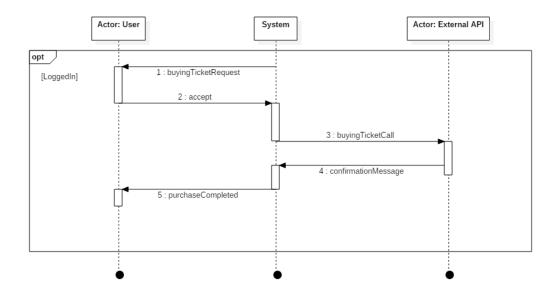

Figure 3.7: Booking phase sequence diagram

Dynamic Directions

Name: Dynamic Directions

Actors: User, external apis, GPS

Goals: FARE RIFERIMENTO AL GOAL CORRETTO

Input Condition:

- The user must be logged in to the system;
- The user must have a running schedule;

Event Flow:

- 1. The user requests the Directions for the travel to the system;
- 2. The system retrieves the user position from his GPS;
- 3. The system retrives from external APIs the directions to give to the user based on his position;
- 4. The system display to the user the updated map and the directions that him must follow in order to arrive to the next appointment
- 5. user doesn't need more directions so he closes the dynamic map.

Output Condition: The User is satisfied with the information gathered until this moment so he decides to close the dynamic map;

Mapping on Requirements:

Events 3 through 5 granted by R17;(AGGIUNGERE I RIFERIMENTI)

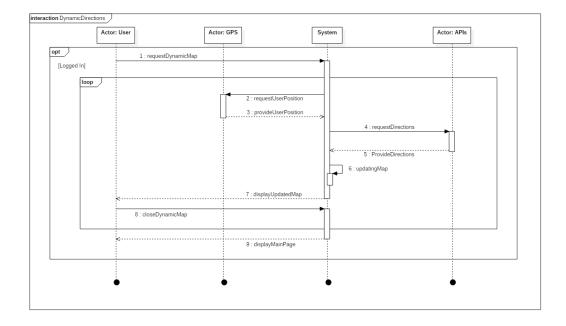

Figure 3.8: Booking phase sequence diagram
